C:Comment: Advanced glycosylation end products are heterogeneous nonenzymatically gly cellular function, thus contributing to tissue lesions in diabetes.
C:Comment: This receptor appears also to mediate the effects of amyloid beta peptide ates in the neurotoxic pathway that produces dementia in Alzheimer's disease.

1. FUNCTION: MEDIATES INTERACTIONS OF ADVANCED GLYCOSYLATED PROTEINS
PRODUCTS (AGE). THESE ARE NONENZYMATICALLY GLYCOSYLATED PROTEINS
WHICH ACCUMULATE IN VASCULAR TISSUE IN AGING AND AT AN ACCELERATED
RATE IN DIABETES.

1. SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN (ISOFORM 1) AND
BECRETED (ISOFORM 2).

1. ALTERNATIVE PRODUCTS: 2 ISOFORMS; 1 (SHOWN HERE) AND 2/RAGESEC;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hudson
